AUTHOR: Gershman, B.N.

TITLE: Concerning an approximation in the theory of propagation of ordinary waves in plasma in a strong magnetic field

SOURCE: Zhurnal tekhnicheskoy fiziki, v.34, no.8, 1964, 1351-1353

TOPIC TAGS: magnetic field plasma effect, electromagnetic wave phenomenon, electromagnetic refraction, plasma diagnostics

ABSTRACT: From the known expression for the refractive index of the ordinary wave in a uniform magnetized plasma when collisions, ion motions, and space dispersion are neglected, the author shows that when the following condition is also satisfied, $f_H^2 \sin^4 \alpha / f_0^2 \gg f_0^2 \cos^2 \alpha / f^2 \gg 1$, where f , f_0 , and f_H are the wave, Langmuir, and Larmor frequencies, respectively, and α is the angle between the wave vector and the magnetic field, the phase velocity is $c \cdot \cos \alpha$ (c is the velocity of light in vacuo) and the group velocity is accordingly in the direction of the magnetic field and of magnitude c . This is reminiscent of the behavior of Alfvén waves, the group velocity of which is also in the direction of the magnetic field. The angle between the

1/2

ACCESSION NR: AP4042918

group velocity of the ordinary wave and the magnetic field was calculated as a function of α under the less restrictive condition $f_{\parallel}^2 \cos^2 \alpha / f^2 \gg 1$ for a number of values of the parameter $d = f_0^4 / f^2 f_{\parallel}^2$, and the results are presented graphically. Even for large values of d the angle between the group velocity and the magnetic field never exceeds $19^{\circ} 29'$. It is suggested that the circumstances noted above may find application to plasma diagnostics. Orig.art.has: 11 formulas and 1 figure.

TITLE: Very low frequency radio emission from the upper atmosphere and its connection with other geophysical phenomena

SOURCE: Uspekhi fizicheskikh nauk, v. 89, no. 2, 1966, 201-225

TOPIC TAGS: vlf, vlf propagation, upper atmosphere, exosphere, artificial earth satellite

ABSTRACT: This is a review, with emphasis on the results obtained since 1960, of the information concerning the state of the exosphere which can be extracted from radio signals of variable frequency between 1 and 20 kcs (whistlers), especially the radio waves generated in the exosphere directly. The most essential results of recent years, obtained by reduction and analysis of whistler observations, are first reviewed. The different types of vlf radiation (hiss, chorus, and discrete radiation) are described and the results of systematic observations obtained with land based equipment and satellites are presented. This is followed by problems involved in the generation of different types of whistlers and an analysis of the significance of vlf noise in the dynamics of the earth's outer radiation belt, and the role of vlf radiation in the

Card 1/2

UDC: 551.59 + 621.396.1

ACC NR: AF6028552

dynamics of the earth's radiation belts. It is concluded that the recent experimental results can throw light on the origin of different types of vlf radiation, and that there are important grounds for assuming that this radiation is produced by high-energy particles in the earth's outer radiation belt and in the aurora zones. There are also reasons for assuming that the vlf radiation plays an important role in the dynamics of the earth's radiation belts. Several problems whose solutions will contribute to clarification of the nature of vlf radiation are listed. Orig. art. has: 6 figures and 35 formulas.

TITLE: Nonhomogeneities of electron concentration arising during the propagation of moving ionospheric inhomogeneities

SOURCE: Geomagnetizm i aeronomiya, v. 6, no. 2, 1966, 246-254

TOPIC TAGS: F layer, ionosphere

ABSTRACT: This investigation is devoted to problems in the theory of formation of nonhomogeneities of electron concentration arising during the propagation of internal, gravitational waves at altitudes corresponding to the F-layer of the ionosphere. The conclusions drawn from this theory are used in the interpretation of patterns associated with the predominant orientation of the directions of propagation of moving disturbances. An estimate is made of the degree of effectiveness of the formation of nonhomogeneities, taking into account the dependence of the concentration of molecules on altitude. The authors thank Ye. Ye. Tsedilina and A. V. Gurevich for permission to view their work before its publication. Orig. art. has: 2 formulas.

Title : Kinetic Theory of Magnetohydrodynamic Waves

Orig Pub : Zh. eksperiment. i teor. fiziki, 1983, 24, No 4, 453-465

Abstract : The propagation of magnetohydrodynamic waves in the direction of a constant magnetic field is investigated by the kinetic-equation method, which makes it possible to take into account the effect of the thermal motion of the particles in the gas. This effect should be substantial in the propagation of magnetohydrodynamic waves in media with sufficiently high kinetic temperature, for example, in the sun's atmosphere where even the medium thermal velocities of the ions can be of the same order or higher than the phase velocities of the waves under consideration. The author starts out with the kinetic equations for the ion distribution functions $F_i(x_i, r_i, t)$ of the ions and $F_e(x_e, r_e, t)$ of the electrons in the electrodynamic equations,

waves in the corona is quite possible. The possibility of the longitudinal waves becoming transformed into transverse ones is considered, as are the conditions under which the radio waves can leave the corona. If waves propagate in plasma located in a magnetic field, the radiation may be "sucked out" from the corona region (taking into account the thermal motion of the electrons). If the plasma wave propagates at an angle to the direction of the gradient of the electron concentration, the radio waves may leave the corona also in the absence of magnetic fields. Such a wave may be produced under the influence of an external agent. If the action of the agent is of short duration, the radio waves will also last a short time (type III of radiation). Radiation of type IV is apparently produced by streams of fast particles, which excite plasma waves. The works in which the drift of the plasma is believed to be the energy source causing the growth of the waves is critically reviewed. In the discussions, I.S. Shklovskiy emphasized that the results of the observations indicate that no one mechanism is capable of explaining all types of radio waves, although most phenomena are apparently due to plasma oscillations. V.L. Ginzburg indicated the difference between the mechanisms of radiation of relativistic electrons from the galaxy and from the sun; in the former case, the angle between the electron velocity and the magnetic field is large, and in the second case it is small. Bibliography, 52 titles.

Title: On the Problem of the Convective Instability in a Magneto-Active Fully Ionized Medium

Original

Periodical: Uch. zap. Gor'kovsk. un-t., 1956, 30, 30-40

Abstract: Discussion of the problem of the effect of the magnetic field on the occurrence of convection of an electron-ion plasma under conditions where the effect of the anisotropy of the electric conductivity, the heat conductance, and the viscosity exert a substantial influence. The work is a continuation of a preceding one (Referat Zhur - Fizika, 1956, 36224), in which only the anisotropy of the electric conductivity and of the heat conductivity are taken into account. Two particular cases are considered: when the direction of the permanent magnetic field is the same as the direction of the acceleration

SUBJECT USSR / PHYSICS CARD 1 / 2 PA - 1894
 AUTHOR GERSMAN, B.N.
 TITLE Notes on the Waves in a Homogeneous, Magnetic, Active Plasma.
 PERIODICAL Zhurn.eksp.i teor.fiz, 31, fasc.4, 707-709 (1956)
 Issued: 1 / 1957

At first some works dealing with this subject are cited. However, on this occasion the author deals only with a paper by J.H.PIDDINGTON, Phil.Mag.46, 1037 (1955) on high-frequent waves (ordinary and extraordinary waves, plasma waves). The author endeavors to clear up the connection between the various types of normal waves with greater accuracy than this was done by PIDDINGTON. At first an equation is derived from the equations of electrodynamics and from the quasihydrodynamic equations of motion in consideration of electron pressure, and this equation is investigated for the nonrelativistic case $\beta_e^2 \ll 1$. $\beta_e = \sqrt{\kappa T/mc^2}$ is the ratio between the average thermal velocity of the electrons and the light velocity c . This inequation is well suited only for the practically most interesting cases of the ionosphere ($\beta_e^2 \sim 10^{-7}$) and the solar atmosphere ($\beta_e^2 \sim 10^{-4} - 10^{-5}$). Here only the behavior of the waves in the special cases $\alpha = 0$ and $\alpha = \pi/2$ is investigated. Expressions for the refraction index of the ordinary, extraordinary, and plasma waves propagated in the direction of the magnetic field are obtained. The occurrence of the plasma wave is connected with taking heat motion into account. For the characterization of the behavior of waves it is very useful and important to study the be-

Zurn.eksp.i teor.fiz, 31, fasc.4, 707-709 (1956) CARD 2 / 2 PA - 1894

havior of the curves for the square of the refraction index at fixed values of β_e and u . Here it holds that $u = \omega_H^2 / \omega^2$ and ω_H denotes the gyrofrequency of the electrons. In connection with the case $\alpha = 0$ (α - angle between the magnetic field \vec{H}_0 and the direction of propagation k) each wave type has its own corresponding dispersion curve. However, $\alpha = 0$, is an exceptional case and at $\alpha \neq 0$ it becomes impossible to characterize the behavior of only one single type of waves by a single steady curve in the case of all n^2 . A diagram illustrates these curves for $\alpha = \pi/2$, which are discussed. The peculiarities found on this occasion apply not only in the case of $\alpha = \pi/2$, but also in the case of the other $\alpha \neq 0$. - The problems dealt with here can also be investigated on the basis of the method of the kinetic equation. From the kinetic investigation there follows the conclusion drawn as to the possibility of damping. The nature of this damping consists in the influence exercised by the heat motions of the particles on the propagation of waves. However, this mechanism is not effective if the conditions mentioned are satisfied. For slightly damped waves it is possible to obtain an equation that is analogous to the quasi-hydrodynamic equation; it is written down here. The radials of this equation furnish the correct solution of the problem if the conditions for the inefficacy of the damping caused by the motion of heat are satisfied. The plasma waves are slightly damped only in the neighborhood of a certain point.

1. Distance VHF Propagation (Dal'noye rasprostraneniye UHF)
Moscow, 1967, Nr 5, pp 22-23 (USSR)
Recently a conference on long-distance vhf propagation was held in Moscow. It was organized by these three organizations: Nauchno-tekhnicheskoye obshchestvo radiotekhniki i elektrosvyazi imeni A.S. Popova (Scientific and Engineering Society of Radio-Engineering and Electromunication), Vsesoyuznyy nauchnyy sovet po radiofizike i radiotekhnike AN SSSR (All-Union Scientific Council for Radiophysics and Radio Engineering, AS USSR), Institut radiotekhniki i elektroniki AN SSSR (Institute of Radio Engineering and Electronics, AS USSR). Over 250 persons took part in the conference. Of the conference, among them scientists and professors from Leningrad, Moscow, Gorkiy, Odessa, Tomsk, and other cities. Fifteen reports were delivered and discussed, of which 5 were devoted to vhf tropospheric scatter propagation. Professor A.G. Aranberg, Doctor of Technical Sciences, opened the conference. A brief outline of today's investigations and uses of tropospheric scatter is presented in the article. Professor A.N. Kazantsev delivered a report on the "Diffused Propagation of Meter Radio Waves in the Ionosphere". He briefly reviewed the materials of the Eighth Plenary Conference of the national Consultative Committee for Radio (Warsaw, September 1966). Soviet and Canadian commercial scatter-propagation communication lines were

 PERIODICAL Uspekhi Fiz. Nauk, 1957, Vol 61, Nr 4, pp 561-612 (U.S.S.R.)
 Received 6/1957 Reviewed 7/1957
 ABSTRACT Starting out from the monograph by Ya.L.Al'pert, V.L.Ginsburg, El.Feynberg
 "The Propagation of Radio Waves" (Rasprostraneniye radiovoln - Gostekhizdat,
 1953, the paper under review deals with some problems of this field which
 have been clarified to a certain extent since the publication of the mono-
 graph. The consideration of the heat motion of electrons in a homogeneous
 medium in the magnetic field leads to the occurrence of plasma waves, the
 consideration of the heat motion of ions, on the other hand, results in
 low-frequency magnetohydrodynamic and quasi-acoustic waves, both with dis-
 persion. In inhomogeneous media it is possible that we have cases where the
 approximation of geometrical optics is no more permissible and where an in-
 teraction of waves takes place which would be independent in the homogeneous
 or quasi-homogeneous case. This is the case in the absence of a magnetic
 field at vertical incidence in the proximity of the reflection point and
 at oblique incidence in the proximity of the point $(\alpha) = 0$, at the exi-
 stence of a magnetic field at a small angle between the wave normal and
 the magnetic field (multiplication of the reflected radio signals), and at
 the beginning of the layer where the concentration of the electrons still is
 small. For the latter case the paper under review computes the boundary

TITLE: Combustion and Formation of the Mixture in Diesel Engines (Sgoraniye i smeseobrazovaniye v dizelyakh) Conference in Moscow (Konferentsiya v Moskve)

PERIODICAL: Vestnik Akademii nauk SSSR, 1958, Nr 9, pp. 115 - 117 (USSR)

ABSTRACT: The Laboratoriya dvigateley Akademii nauk SSSR (Engine Laboratory of the AS USSR) convened a conference which took place from June 10 to June 12. Apart from Soviet scientists from various cities of the USSR scientists from China, the German Democratic Republic and Czechoslovakia participated in the conference. Theoretical, experimental and methodical problems were treated. The following reports were delivered: I.I. Gershman, Ye.I. Gulin spoke about the influence of spraying on the process of combustion. V.Ya. Basevich on the empiric law of combustion of fuel drops in connection with spraying in the air current. Yu.B. Sviridov, D.I. Ryabov recommended a new diffusion kinetical model for the ignition and combustion of sprayed fuel.

Card 1/4

Combustion and Formation of the Mixture in Diesel Engines. SCV/30-96-9-44/51
Conference in Moscow

A.N.Voinov spoke about self-ignition of homogeneous mixtures.
R.V.Mokhov about the influence of chemical admixtures to
the fuel on retarded ignition in the Diesel engine.

A.S.Sokolik, O.A. Machalicky (Czechoslovakian scientist)
reported on the physico-chemical basis of the so-called
M-process in Diesel engines.

N.R.Briling on an improvement of the stroke of Diesel engines
by the construction of motors with short stroke.

A.S.Sokolik, Ye.S.Semenov dealt with the investigation of
the working cycle in the cylinder of the engine by means of
a compensated thermo-anemometer.

M.S.Khovakh investigated the influence of air turbulences
on the torch formation of the fuel in the case of injection
by means of the kinematographical method.

V.Ye. Mazing spoke about screening of the intake valve.

B.S.Stechkin about heat production in the engine and its
influence on the stroke.

I.I.Vibe, N.K.Arslanov, Z.M.Minkin, K.I.Genkin and others
reported on the problem mentioned by Stechkin.

A.S.Sokolik, V.P.Karpov dealt with the antechamber torch

ignition as basis of a new type of engines.
V.N.Svobedov recommended a new method of controlling
the process of combustion in the Diesel engine.
Films about the process of combustion were shown which
were produced by M.D.Apashev in the Laboratoriya dvigateley
(Engine Laboratory). The following items were regarded as the
principle trends in the development of Diesel engines:
increase of the power output per liter of the engine by
means of a supercharger, increase of the number of revolutions
as well as fuel concentration. On the occasion of the 100th
anniversary of Rudolf Diesel (Rudol'f Dizel) I.A.Men'shikov
spoke about Diesel's life and work.

PERIODICAL: Avtomobil'naya promyshlennost', 1958, Nr 11, pp 43 - 45, (USSR)

ABSTRACT: The manifold problems involved with an increase in the liter capacity in diesel engines by, e.g. an increase in rpm, were the subject of the conference on the combustion and carburation in diesel engines convoked by the AS USSR in June 1958. The conference was attended by representatives of 78 research and training institutions and enterprises of the USSR, and by guests from the Satellite countries. A total of 30 papers and communications previously given to the attendants for study were discussed. Theoretical problems of the physical phenomena of the processes within automobile and other combustion engines were treated by Academician B.S. Stechkin, Professor A.S. Sokolik, Candidates of Technical Sciences A.I. Serbinov and Yu.B. Sviridov. R.M. Mokhov was concerned with problems of the cetane number. The paper of Prof. A.S. Sokolik and V.I. Karpov dealt with the pre-combustion chamber fuel-spray ignition principle, and

issledovatel'skiy dizel'nyy institut (Central Scientific Diesel Research Institute) on an improvement of the operation process of engines with cylinders of 230 and 180 mm diameter, having the combustion chamber in the crown of the piston. The problem of noxious fumes developing in the combustion process and possible ways to their removal was treated by A.S. Sokolik and supplemented by material presented by the Prague Automobile Institute that is especially concerned with research in this particular field. Doctor of Technical Sciences A.N. Voinov spoke about the process of combustion from compression and from the heated surface of a homogenous mixture. The paper of Correspondent Member of the AS USSR, N.R. Briling dealt with work on the creation of a short-stroke, fast-speed DB-engine. Candidate of Technical Sciences A.S. Khachiyan considered the possibility of controlling the injection principle by way of a design selection of the elasticity magnitude of the pump and nozzle drive, as was checked in the testing of the DB-67 engine. Candidate of Technical Sciences S.I. Kuptsov has worked out a hydraulic fuel feed system for the DB engine, which simplifies the design. Professor D.N. Vyrubov sketched still open problems

A Conference on the Combustion and Carburation in Compressed-Ignition
Engines

concerning the oxygen feed to the superconcentrated mixture. Professor M. A. Khaylov investigated several aspects of heat liberation and also stressed the necessity of creating high-quality measuring devices. Doctor of Technical Sciences M. D. Apishev demonstrated the process of combustion in an engine with a transparent cylinder in a plane-parallel flow, taken by him with a rapid-motion film camera. A. P. Mironov showed a film on the process of fuel injection into a turbulence chamber of cylindrical shape with transparent side walls. The conference concluded that despite great progress in the concepts on the nature of combustion in diesel engines, the developmental requirements of the diesel engine-building sector have not yet been adequately covered. The establishment of a permanent research group on these problems in Moscow, a union of the scientific and technical

Investigation of Atomization (Cont.)

SOV/2764

COVERAGE: This issue consists of two articles devoted to research on the atomization and combustion of Diesel fuels with varying physicochemical properties. The tests were conducted with laboratory apparatus without the use of engines. The equipment had a fuel unit of the divided type. The research included the study of flame development during injection from nozzles equipped with pin atomizers; variation of atomization during injection phases and the dependence of the atomization process on the design, regulation, and operation of the fuel apparatus and on the parameters of the medium into which the fuel is injected; effect of the quality of atomization on the ignition and combustion of the fuel; and realization of optimum conditions for the atomization and evaporation of fuels. It was determined that there exists an optimum ignition delay resulting in the highest combustion rates. Bibliographies are given at the end of each article.

TITLE Ignition and combustion of Diesel fuel as dependent on the quality of atomization

PERIODICAL Referativnyy zhurnal, Silovyye ustanovki, no. 4, 1962, 72, abstract 42.4.450 In collection "Sgoraniye i smeseobrazovaniye v dizelyakh". M., AN SSSR 1960, 52-60

TEXT Investigations were carried out with the standard fuel injection equipment of the КД-35 (KD-35), engine using the ПШ 1.5-15 (RSh 1.5-15) atomizer and standard Diesel fuel. It was established that the degree of atomization of the fuel may be characterised by the mean volume diameter of the drop, which can be determined in practice; when ignition delay is reduced due to an increase in initial air temperature, the mean combustion rate reaches a maximum determined by the quality of mixture formation; for rapid ignition and combustion the fineness and homogeneity of the fuel should vary during injection according to a definite law. There are 5 figures and 7 references.

TITLE: Preparation and certain properties of homogeneous carboxylic membranes based on a copolymer of styrene and maleic anhydride

SOURCE: Zhurnal prikladnoy khimii, v. 38, no. 12, 1965, 2869-2870

TOPIC TAGS: copolymer, styrene, maleic anhydride, permeability measurement, ion exchange, ion exchange membrane, RESISTIVITY

ABSTRACT: A styrene-maleic anhydride homogeneous copolymer⁵⁵ membrane was prepared and compared with hydrocarbon polymeric membranes containing sulfo-groups for ion exchange selectivity in concentrated alkaline solutions, electrical resistivity and electrochemical stability. The work was performed in an attempt to prepare ion exchange membranes having ion-exchange selectivity and electrical resistivity superior to those of the hydrocarbon polymeric membranes containing sulfo-groups. The copolymer was prepared by heating equimolar quantities of styrene and maleic anhydride in steam for 6 hours. The copolymer product was purified, hydrated for 6 hours at 70°C by treatment with an excess of 10 normal aq-

Card 1/2

L 13527-66

ACC NR: AP6002224

uous KOH, washed with methanol, and dried. The membranes (85 microns thick) were drawn from 30% aqueous solution of copolymer. The electrical resistivity (in $\text{ohm}\cdot\text{cm}^2$) of copolymer membranes treated for 1-30 days in 10 normal KOH solution was determined at 20°C. It was found that homogeneous cation-exchange membranes made of styrene-maleic anhydride copolymer display high exchange selectivity in concentrated alkaline solutions. The styrene-maleic anhydride copolymer membranes have higher electrical resistivity than membranes made of hydrocarbon polymer containing sulfo-groups. Orig. art. has: 2 tables.

influence of the burning temperature and fineness of grinding on the properties of plaster gypsum. M. I. Serabashan. *Soviet. Material.* 1939, No. 7, 21-7. With increase of burning temp. for the same fineness of grinding, the normal thickness of the paste decreases. Increase of the temp. to 150-70° accelerates the setting, a further increase retards setting on account of the formation of a modification of sol. anhydrite in the product. Increased fineness of grinding at const. burning temp. leads to no increase of the thickness of the paste and to an acceleration of the setting; the mechanical strength remains nearly unchanged. Hardening can be accelerated by drying the samples at 55° to const. weight during 22 hrs. The rate of hardening depends on the vol. of the samples.

TITLE: A Study of the Sodium Fluosilicate Used in the Capacity of a Mineralizer in the Calcination of Cement Raw Mixtures

PERIODICAL: Tsement, 1959, Nr 2, pp 17-22 (USSR)

ABSTRACT: Cements now produced must contain a good deal of active minerals and a minimum quantity of loose calcium oxide. Calcination of clinker of such composition presents some difficulties and usually must be operated under increased temperatures. These difficulties may be levelled by application of mineralizers in the raw material mixture. The by-product from the superphosphate plants at the Urals, Southern regions and Kazakhstan, consisting almost entirely of Na_2SiF_6 , can be successfully applied for the mineralization purposes. The Nittsement (State All-Union Scientific Research Institute of the Cement Industry) has studied the possibility of using sodium fluosilicate, barium sulfate, calcium sulfate, ferric oxide, and ferrous sulfate in the

Card 1/4

SV/101-59-2-5/13

A Study of the Sodium Fluosilicate Used in the Capacity of a Mineralizer
in the Calcination of Cement Raw Mixtures

capacity of mineralizers, the latter being a waste product of the fertilizer plants containing sodium fluosilicate combined with fluorine salts. Mineralizing action of these admixtures was compared with the action of fluorspar. Experiments performed at the Podol'skiy opytyny zavod (Podol'sk Experimental Plant) belonging to the State All-Union Scientific Research Institute of the Cement Industry, with the laboratory electric furnace, followed by experiments with 8 m and 16 m kilns, have proved that the mineralizing properties of sodium fluosilicate are superior to those of fluorspar. The addition of 1.2% of sodium fluosilicate favorably influenced conditions of the calcination process. The amount of loose calcium oxide in the clinker samples was found to be small. Its content was 0.34% against 1.68% found in the clinker calcinated without mineralizer. For verification purposes, samples of clinkers were extracted from the kilns during the calcination

Card 2/4

SC7/101-59-2-5/23

A Study of the Sodium Fluosilicate Used in the Capacity of a Mineralizer
in the Calcination of Cement Raw Mixtures

process. Figure 3 and Figure 4 show the effect of the introduction into the mixture of sodium fluosilicate in the fluid and hard-material periods of the process. In the 8 m kiln, for calcination of the mixture with mineralizer, the temperature has dropped by 80 to 90°, against the temperature measured during the process without mineralizer. Comparative strength tests have proved, for cements obtained from ground clinker produced in 8 and 15 m kilns, with the addition of gypsum, that under compression, the strength was much the same for samples made of cement with or without mineralizer. As for the tensile tests, the strength of cement containing Na_2SiF_6 as mineralizer was greater than that of the cement not containing sodium fluosilicate. Concluding, the authors state that sodium fluosilicate contributes to the activation of the calcination process of clinker. Introduction of 1.2% of Na_2SiF_6 enables

A Study of the Sodium Fluosilicate Used in the Capacity of a Mineralizer
in the Calcination of Cement Raw Mixtures

to reduce the moisture of the slime by 8%, but it also may create a state of a temporary thickening of the slime. In view of such changeable action, depending upon the initial composition of the raw material mixture, cement plants must thoroughly consider the future effect of the introduction of this mineralizer into their raw material, prior to the calcination. There are 2 graphs and 5 tables.

TITLE: Heat Effects During Melting in the System Lead-Tin-Bismuth
(Teplovyye efekty pri plavlenii v sisteme svinets - olovo -
vismut).
(I. The Equilibrium Diagram of the Ternary System Lead-Tin-
Bismuth) (I. Diagramma ravnovesiya troynoy sistemy Pb-Sn-Bi).

PERIODICAL: Zhurnal Fizicheskoy Khimii, 1958, Vol. 32, Nr 1, pp. 12-18
(USSR)

ABSTRACT: The heat of fusion as well as the temperature dependence of
the specific heat of alloys of the ternary system lead-tin-
bismuth were measured. This was done in order to check the
possibility of an expansion of the "configuration"
approximation to ternary metal systems, as well as in order
to be able to calculate the surfaces separating the domains
of the diagram for the respective ternary system. The
measurements were carried out in an adiabatic calorimeter for
high temperatures (ref. 5-7). Lead, tin and bismuth were used
chemically pure for the production of the alloys. 48 alloys
were investigated. The author shows that in all $C = C(t)$ curves
three jumps exist. C = specific heat. These jumps correspond
to the passage through the plane of the ternary eutectic, the

Card 1/2

Heat Effects During Melting in the System Lead-Tin-Bismuth. 76-1-2/32
(I. The Equilibrium Diagram of the Ternary System Lead-Tin-Bismuth)

surface of the binary eutectic and the surface of the liquidus line. The temperatures of the jumps at the specific heat were used for the structure of the polythermic cross sections. Within the ranges of the respective cross section the phase limits were determined according to experimental data concerning the concentration dependence of the eutectic and peritectic heats in alloys. According to the known polythermic cross sections the isothermic cross section of the ternary diagram at room temperature was built up. It coincides with that of ref. 7 and 8.

The topic was suggested by B. Ya. Pines and discussed with Ya. Ye. Geguzin.

TITLE: Heat Effects in the Ternary System Lead-Tin-Bismuth on Melting (Teplovyye efekty pri plavlenii v troynoy sisteme svints-olovovismut)
II. The Calculation of the Heat Effects of the Phase Transition for Ternary Metallic Alloys (II. Raschet teplot fazovykh perekhodov dlya troynykh metallicheskih splavov)

PERIODICAL: Zhurnal Fizicheskoy Khimii, 1958, Vol. 32, Nr 2, pp. 258-261 (USSR)

ABSTRACT: The calculation of the heat effects in the phase transitions of ternary alloys were carried out with a "configuration" approximation. As in the calculation of binary alloys (Reference 1) the heat of fusion measured experimentally is assumed to consist of two terms of a sum: the configuration of fusion Q_c and the heating heat within the decomposition domain Q_e . The computation of the configuration melting heat of ternary alloys is given. The total configuration heat of

Card 1/4

76-32-2-5/38

Heat Effects in the Ternary System Lead-Tin-Bismuth on Melting. II. The Calculation of the Heat Effects of the Phase Transition for Ternary Metallic Alloys

fusion of the alloy can be represented as difference of the configuration energies in liquid and solid phase :

$Q_k = E_{\text{liquid}} - E_{\text{solid}}$. The energy of the ternary solution with the concentrations of the components x_k and x_l can, as was shown in Reference 2, be represented by equation (2). For the general case of a four-phase equilibrium in a three-component system with complete mutual solubility of the components in the liquid phase (which is limited by the solubility of the components in the solid phase and the formation of the ternary eutectic from solid solutions) the equation (3) is obtained, taking into account formula (1). Based on it the formula (6) for the whole configuration heat of fusion is obtained. For a three- and two-phase equilibrium the formula (6) takes a more simple form. - The heat of the alloy of the concentration $x_k x_l$ at the transition through the plane of the ternary eutectic from the domain with three solid phases $\alpha + \beta + \gamma$ to domains where one of the phases is liquid, i.e. within the domain $\alpha + \gamma + L$, $\alpha + \beta + L$, $\beta + \gamma + L$ - can be expressed by the equation (7) as drop

Card 2/4

76-32-2-5/38.

Heat Effects in the Ternary System Lead-Tin-Bismuth on Melting. II. The Calculation of the Heat Effects of the Phase Transition for Ternary Metallic Alloys

of energies before and after the passage through the eutectic plane. From this equation the formula for the wanted heat at the passage through the eutectic plane (8) is then obtained, taking into account the formula (5) for the configuration energies of the phases. Different from the case of a four-phase equilibrium the transition takes place through the surface of the binary eutectic in the ternary system, i.e. in the case of a three-phase equilibrium within a certain interval of temperature. - In the second chapter the constants of the ternary system are determined. These constants obtained for the lead-tin-bismuth system offer the possibility to build up by calculation the phase boundary surfaces for the given system. The comparison of the formulae given here for the calculation of the heat of phase transitions with experimental results for the lead-tin-bismuth-system showed a complete agreement as well as the applicability of these formulae within the whole range of concentration of the

TITLE: Curie temperature of cementite alloyed with nickel, manganese, and silicon
PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 3, 1962, 4, abstract 3I24 ("Sb. nauchno-tekhn. tr. N.-1. in-t metallurgii Chelyab. sovnareshchik", 1961. no. 3. 195-199)

TEXT: A determination was made of the Curie temperature T_C of alloyed cementite as a function of its Ni, Mn, and Si content. The investigation made use of steel with the following composition (in %): C 0.55 - 0.70, Mn 0.16-4.33, Ni 0.12 - 11.1, Cr 0.09 - 0.20, Si 0.020 - 0.028. It was established that Ni has no noticeable effect upon the T_C of the cementite. Mn strongly lowers the T_C and, at high Ni contents the T_C is located in the neighborhood of 0°C . The Si seems to increase the T_C of the cementite but since a large quantity of non-metallic silicate impurities is contained in the steel, making it impossible to obtain a pure carbide deposit, the problem of the influence of Si requires additional investigation.

TITLE: Characteristic temperature of alpha-iron alloyed with manganese, molybdenum, silicon and carbon

PERIODICAL: Fizika metallov i metallovedeniye, v.14, no.5, 1962, 766-769

TEXT: The object of this work was to estimate the atomic interaction forces ($m\omega^2$) involved when alloying alpha-iron. The characteristic temperature was found from the elastic moduli as measured by the dynamic resonance method. The single-phase solid solutions studied contained up to the following weight percentages of alloying elements: 5.4 Mn, 5.3 Mo, 6.3 Si, 1.2 C. Within these concentrations the characteristic temperature of alpha-iron changes only just noticeably on alloying with silicon and hardly at all on alloying with molybdenum. Manganese (5.8 at.%) and carbon (5.47 at.%) lower the temperature by 6 and 10°C respectively. Within the same concentration ranges the value of $m\omega^2$ falls by 3, 5 and 7% on alloying alpha-iron with manganese, silicon and carbon respectively, and rises by

TITLE: Curie points of cementite after isolation from alloy
steels

PERIODICAL: Akademiya nauk SSSR. Izvestiya. Otdeleniye
tekhnicheskikh nauk. Metallurgiya i gornoye delo.
no.1, 1967, 119-120

TEXT: Since the magnetic properties of isolated alloyed
cementite have not been adequately studied and existing literature
data are contradictory, the authors determined the Curie points of
cementite isolated from seven alloy steels (composition given).
The steels were induction melted and the ingots forged into rods
from which specimens were prepared. The specimens were homogenized
and hardened from 950 or 1300°C in a 10% potassium hydroxide
aqueous solution or oil. Each type of steel was annealed by
5 to 6 different methods to obtain the maximum content of the alloy
element in cementite. The cementites were isolated electrolytic-
ally. The proportions of the alloying elements in the carbide
residues were determined chemically and the amounts dissolved in a

given carbide were determined from changes in volume of the elementary lattice or from the spacing. The effect of temperature on the magnetization of carbide powder was determined with a magnetic balance in fields far removed from saturation. It was found that the Curie point of the cementite was not changed by alloying the steel with nickel, niobium or vanadium. Alloying the steel with tungsten somewhat lowered the Curie point temperature and alloying the steel with molybdenum reduced it still more. Manganese, which dissolves in cementite in large quantities, caused a very marked decrease in the Curie point temperature. There are 1 figure and 2 tables.

TITLE: Investigation in the Field of the Alkane Sulfonic Acids
(Issledovaniye v oblasti alkansul'fokisl'ot). XIX. Chlorination
of the N-Aryl Amides of Methane Sulfonic Acid
(XIX. Khlorirovaniye N-arilamidov metansul'fokisl'ot)

PERIODICAL: Zhurnal obshchey khimii, 1959, Vol 29, Nr 6,
pp 2012-2016 (USSR)

ABSTRACT: The object of the present paper is the chlorination of anilide,
of the toluidides and anisidides of methane sulfonic acid.
The anilide chlorinates with the formation of 2,4-dichloro
anilide, as is the case also with the anilides of the ethane
and butane sulfonic acids (Ref 1); in the presence of ZnO
better yields were obtained; the p-toluidide is chlorinated
to the tetrachloro-p-toluidide; in this case however, ZnO
inhibits the reaction. In the chlorination of the o-toluidide
a rapid formation and a separation of the crystalline monochloro-
o-toluidide is observed during the first 5 minutes; in the
case of a longer duration of the chlorination (up to 45 min)
a mixture of mono- and tetrachloro-o-toluidides is formed.

Card 1/3

Investigation in the Field of the Alkane Sulfonic SOV/79-29-6-52/72
Acids. XIX. Chlorination of the N-Aryl Amides of Methane Sulfonic Acid

The chlorination of the o- and p-anisidides leads to the dichloro anisidides; in the case of the p-anisidide, the tetrachloro benzoquinone is formed as side-product, in the case of o-anisidide, tetrachloro-o-anisidide is formed. The chlorination was carried out by means of gaseous chlorine. If the chlorination takes place with chlorine dissolved in dichloro ethane, monochloro toluidides (optimum ratio 1:2) result as main products in the chlorination of the p- and o-toluidides (at ratios of the chlorine to the initial toluidide 1:1, 1:2, 1:3, 1:4). In this connection tetrachloro toluidides form as side products in very small amounts. The determination of the position of chlorine in the nucleus by means of hydrolysis into the corresponding amine is not quite reliable since the isomeric monochloro-o-toluidines and their N-acetyl derivatives have very close constants

[(Formulas (1) and (2))]. Thus, the influence exercised by the structure of the N-arylamides and the influence exercised by the reaction conditions on the character of the forming compounds was shown.

5637. The correlation coefficient as a criterion of the acoustical quality of a closed room. S. G. GERSHMAN. *Zh. Tekh. Fiz.*, 21, 1492-6 (No. 12, 1951) In Russian.

A preliminary account of a theoretical and experimental study. The dependence of the auto-correlation function R on the time interval of correlation is represented by curves of calculated and measured values, for several different audio-frequency bands, in a non-reverberant room. Comparison of values of R for these and for rooms with various degrees of reverberation, and sounds with various directional properties and frequency spectra, indicate that in determining the sound quality of a room, R is a more sensitive parameter than the reverberation time, since R to a greater extent characterizes the sound process at a given point.
